

Wildlife group accuses province of rabies 'fear mongering' and wasting millions

Ontario Wildlife Coalition accuses province of 'fear mongering,' but ministry says it's a 'world leader'

The Hamilton area has been dealing with an outbreak of raccoon rabies since 2015. One environmental group is taking issue with how the province has been dealing with the problem. (Skedaddle Humane Wildlife Control)

provincial wildlife group alleges the province is "fear mongering" over the dangers of rabies in Ontario, and is wasting millions of dollars in public funds on its program to fight the virus.

The province has spent \$8.6 million over the last three years on rabies control,

and maintains it is managing a successful program that has contained southern Ontario's current raccoon rabies outbreak.

One expert says the program costs relatively little, considering the money goes toward fighting an almost invariably fatal disease.

But the Ontario Wildlife Coalition (OWC) — a group that focuses on policy issues and advocating on behalf of wildlife — says the Ministry of Natural Resources and Forestry is just looking to "keep funding flowing," and not actually solve a problem.

The group argues rabies isn't a widespread risk, and there are cheaper ways to control the virus.

The province, by contrast, says rabies isn't a widespread problem because its program is so effective.

In a letter sent to the ministry and the heads of Ontario's political parties obtained by CBC News, the OWC says it is "urging" the province to take a close look at the current rabies program and its costs.

"There's a lot of money being spent and very little accountability," said Donna DuBreuil, President of the Ottawa-Carleton Wildlife Centre, and member of the OWC.

"There needs to be more oversight in terms of this ministry."

For years, southern Ontario had been virtually rabies-free. Then back in 2015, a dog named "Mr. Satan" got into a brawl with an aggressive raccoon in the back of

a Hamilton animal control van.

The baiting programs are hugely costly, and you have to wonder what kind of effect they're actually having.

- Donna DuBreuil, President of the Ottawa-Carleton Wildlife Centre

That raccoon tested positive for the virus, marking the first documented case of raccoon rabies in the province since 2006, which ballooned into the first widespread outbreak since 1999.

The province then started an aggressive aerial and ground baiting vaccine program in an attempt to quell the spread of the virus in wildlife populations.

The OWC argues for both economic and health reasons, it makes more sense to focus on vaccinating pets and livestock than spend millions on programs that target far less accessible wildlife through expensive aerial and ground baiting.

"The baiting programs are hugely costly, and you have to wonder what kind of effect they're actually having," DuBreuil said.

But Ministry spokesperson Jolanta Kowalski told CBC News in an email that the program has been highly effective.

"If no control actions were taken, it is predicted that rabies would have spread beyond Toronto and London by the end of 2017, and past Barrie, Peterborough and Chatham by the end of 2018," she said.

A multi-million dollar fight

The province says it spent \$600,000 on fighting rabies in Ontario in the 2015/2016 fiscal year, followed by \$4.3 million in 2016/2017, and \$3.7 million in 2017/2018.

When compared to numbers in nearby New York State — which [frequently leads the U.S.](#) in reported numbers of rabid animals — Ontario appears to spend much more on its rabies program, the OWC says in its letter.

According to a report from [NPR member station WRVO](#), New York State lawmakers allocated about \$772,770 for rabies prevention and research efforts in 2016, as well as an additional \$150,000 to help local governments pay for treatment if someone is bitten by a rabid animal.

In its correspondence to the province, the OWC says a small "but determined" group of wildlife managers have made rabies a thriving "industry," despite "its virtual non-risk" in North America.

"The 'industry' is made up of government scientists, academics, vaccine and bait manufacturers and trappers who have grown dependent on public funds," the letter says.

The Ministry of Natural Resources has dropped hundreds of thousands of raccoon vaccine baits in the area in a bid to quash an outbreak of raccoon rabies in Hamilton. (Hannah Yoon/The Canadian Press)

But the ministry maintains that it's not that simple. In the U.S., the federal government is responsible for rabies elimination and control — individual states don't lead rabies elimination programs.

"So unlike Ontario, New York State has rabies throughout the entire state and isn't currently trying to eliminate it," Kowalski said. "New York State regularly documents 400–500 cases of rabies per year. The costs will be ongoing for years to come."

Scott Weese, a professor and infectious disease specialist at the Ontario Veterinary College at the University of Guelph, told CBC News that it's difficult to compare Ontario with New York state, as the public health system in the U.S. "isn't exactly flush with cash."

- **[Protect your pets from rabies threat as weather warms, province warns](#)**

Ontario also has the advantage of the Great Lakes blocking direct access from many states, forcing rabid animals to sneak across more narrow corridors, Weese said. For New York State to attempt what Ontario is doing, it would need all adjacent states to commit to a similar program.

"They're not really in a situation where they could do good eradication unless they convinced all the states that are physically connected to them to do it," Weese said. "We've got that advantage."

Human rabies deaths exceptionally rare

It's tough to discount the seriousness of the rabies virus itself. Most infected humans who show symptoms don't survive, and those who do usually suffer severe neurological damage. In most parts of Ontario, cats and dogs have to be vaccinated for rabies by the time they're three months old, and then given booster shots every one to three years.

But human cases of rabies are exceptionally rare in Canada — something [the federal government says](#) is "largely due to excellent prevention and control programs." Since reporting started in 1924, 25 people in six provinces have died of rabies, with seven of those deaths coming in Ontario. The last death on record in Ontario came in 2012, but that person was exposed to the virus while outside of the country.

The last death in Canada that was caused by an infection that occurred in this country was an Alberta man who died after he was bitten by a rabid bat in 2007.

The province says that without rabies control actions, models predict that rabies would have spread from the current raccoon rabies outbreak area to Toronto and London by 2017, and past Barrie, Peterborough

and Chatham by 2018. (Kerry O'Gorman)

Weese says the idea of scaling down rabies spending is an issue that often rears its head with infection control, where "success breeds complacency."

"So if you have a successful program [and] you don't see the disease, people start paying less attention to it and saying, 'Why are we spending all this money on rabies, because it doesn't kill people in Canada,'" he said.

"Well maybe it doesn't kill people in Canada because we have a good control program."

Finding room for public consultation

The OWC also takes issue with repeated "exemption orders" provided for the rabies program under the province's environmental assessment act, which removes aspects of public consultation from the process. They have been in place since 2002.

"Why would the Minister need such an order?" the group's letter reads. "Why would the Minister not welcome public comment and even a public challenge to the rabies programme given the skyrocketing costs and controversial nature of the previous programme?"

The province says those orders are contingent on factors like the success of the program, and notifying the public in the area where baiting is taking place. The ministry also publicly posts its annual rabies control plans on the environmental registry, Kowalski said.

Weese said the province has been "engaging relevant experts in the field," but he doesn't know how far that should go in terms of consulting the public when time is a factor.

"You can't say, ok we've got raccoon rabies in Hamilton, we're going to do a six-month review to see what we should do ... you need to do things quickly with infectious diseases or you miss your window of opportunity."
